Space walking in my backyard!

I wanted a bino viewer for a while now the the prices just kept away. This one is very well made, metal not plastic and it comes with the eyepieces. Fit and finish was most impressive. Performance, well it was like space walking in my own back yard. Saturn was floating in the eye piece like 3D magic. Orion's nebulae was like standing in a misty cloud. It comes with a barlow that helps eliminate multiple eye pieces. I scored it a 9 only because it uses 1.25 eyepieces but if we used 2."eyepieces it would be quite heavy. I will use it every night.

Clear skies

A real bargain

Well I finally dived in to the binoviewer world, and although the seeing conditions were less than optimal I have to say that the WOW factor is pretty high. I trained my scope on an obvious target, M42, and I was totally amazed at how much more detail I could see. A little tweaking of focus and the finer details begin to emerge. I can understand how easy it is to get hooked on using these on a regular basis. I was impressed with the construction and quality of the WO Binoviewers. Focusing was a snap with the helical eyepiece focusers. I am sure that high end binoviewers may offer more features or clear aperature than this model, but I have to say that my money was well spent. I am looking forward to combing the night sky with two eyes.

An Excellent Addition to Any Eyepiece Case

I am a member of the Escambia Amateurs Astronomy Association, located in Pensacola Florida and I wanted to tell you how pleased I am with your product. We set up on Saturday, April 1st at the University of West Florida, to observe the occultation of the Pleiades by the Crescent Moon. I was using them on an 8" SCT, it may interest you to note that on that evening they were being used with a 3.3 field flattener, (we had forgotten it was on while we were recording the occultation on DVD with an astrovid unit), and my Meade 2x barlow lens. The views through the bino-viewer were crisp and spectacular, I felt like I could reach around the front of my scope and grab the Moon.
